PROFESSIONAL SUMMARY

Computer Science and Engineering student (CGPA 8.5) with hands-on experience across software development and data analytics, gained through academic and hackathon projects. Strong foundation in programming, databases, and problem-solving, with a final year project applying machine learning to real-world data. Quick learner with good communication and teamwork skills, eager to contribute to and grow within a professional organization.

TECHNICAL SKILLS

- Programming Languages: C, C++, Python
- Web Technologies: HTML, CSS, JavaScript, Django | Databases: MySQL, PostgreSQL, SQLite
- Data Visualization & Analytics: Power BI | Tools & Platforms: Git, Google Cloud
- Core: OOPs, DBMS, OS, Computer Networks, Software Engineering

EDUCATION

Sri Ramakrishna Institute of Technology — B.E. Computer Science and Engineering *2027*
University: Anna University, Chennai | Course Type: Full-Time | CGPA: 8.5

Ambal Matriculation Higher Secondary School — HSC *2023*
Board: Tamil Nadu State Board | Course Type: Full-Time | Percentage: 88.5%

Ambal Matriculation Higher Secondary School — SSLC *2021*
Board: Tamil Nadu State Board | Course Type: Full-Time | Result: Pass

ACADEMIC & RESEARCH PROJECTS

Hybrid Framework for Data Leakage Detection and Prevention — Final Year Project

- Designing a hybrid data security system that combines three machine learning modules — content classification, user behavioral analytics, and exfiltration prediction — to detect and prevent insider data leaks within an organization, grounded in peer-reviewed IEEE/Springer research on insider threat detection.
- Built the content classification module: processed and labeled a large email and document dataset by sensitivity level (Low/Medium/High/Critical), then trained a text classification model to automatically flag sensitive files based on their content.
- Currently extending the system with behavioral anomaly detection to flag unusual user activity, an exfiltration prediction model to anticipate potential data leaks, a fusion layer to combine risk scores from all modules, explainable AI (SHAP) for transparent decision-making, and a live monitoring dashboard built in Streamlit. Tech stack: Python, Scikit-learn, XGBoost, SHAP, Streamlit, SQLite.

AI-Based Internship Recommendation System — SIH 2025

- Built an AI-driven system that recommends internships to students by matching their skills and profile data.
- Implemented skill-matching algorithms to generate personalized, ranked internship suggestions for each user.
- Developed as part of Smart India Hackathon 2025, addressing skill-based career guidance for students.

Image Recognition Chatbot — SIH 2024

- Built a chatbot that combines image recognition with a machine learning model to detect objects in user-submitted images.
- Designed response-generation logic that produces context-aware replies based on the detected objects.
- Developed as part of Smart India Hackathon 2024, integrating computer vision with conversational AI.

Dynamic Survey Performance Dashboard

- Built an interactive Power BI dashboard to analyze survey trends and respondent data across multiple metrics.
- Generated insights through data visualization and KPI reporting for faster interpretation of results.
- Enabled stakeholders to track performance metrics and make data-driven decisions from survey outcomes.

Smart Printout Pre-order System

- Developed a web-based Smart Printout Pre-order System that allows users to upload documents and customize printing preferences remotely.
- Implemented automated cost estimation and centralized order management to streamline the printing process.
- Designed an admin module to efficiently process and track print requests, reducing waiting time and simplifying the overall workflow.
